

After following the prompting techniques it helped me a lot to understand how different prompting techniques can get better results and get best out of LLMs.

1. I used novice/power user methods and understood that giving AI context drastically changes the output. Output was clear and more helpful and I understood that instead of going to and fro with AI and wasting time we should take some time and make a proper prompt with some context and get a most suitable result according to our needs instead of getting some random answers.
2. What AI knows and guesses is very important to get best results, because I asked AI about the answers like which AI knows like cv/resume it knew exactly it meant but when I asked about my city headlines and asked it to tell me if it is not sure, although it gave me news from some prominent news papers but at the end it told me that these are some headlines but I can not be sure if these are the answers I wanted. So asking it to be vigilant of what it knows makes sure it stays careful and does not make up answers.
3. I asked it questions which it was pre trained on like summary of Romeo and Juliet it gave instant answer but when I asked it to do web research about my city weather, it gave me Islamabad weather which I am not living in so I may need to specify these details in future and when I asked it to do deep search and give me a structured report on Agentic AI, it took its time but gave me very well structured and professional report on recent developments in Agentic AI. So it was smart enough to change its modes and outputs methods according to my needs instead of me changing its modes from reasoning to low to high thinking.
4. When I asked it to think hard it did think hard and instead of giving me some general results it pondered over my specific needs and gave me a very well thought out output.
5. When my prompt included words like “ don’t you think or I think “ AI tend to agree with me and its answers were like “ you are right” and when I instead of using these phrases I simply asked it to compare some things and do not not suggest me something its answers were more reasonable and instead of agreeing with me it gave answers on merit.
6. Iteration did help me to clear out some confusion on a matter I discussed with AI, I asked options it gave me I choose one made some more changes in it and then asked AI to asked it again to go over it and in this process i found a very reasonable output instead of asking it and getting some rigid answers.
7. I gave AI an image of a keyboard where words were not very clear , but just from layout it gave me very clear image of my external keyboard along with the letters clearly printed on it according to its model even the functions which work with ctrl were also printed on the lower side which were not visible at all.
8. With Claude I made a water intake tracker, it was pretty good I asked it to change its color scheme which it did then added some more functions, add glass of water was not working asked it to fix it which it did in first try so overall it was very good and surprisingly fast to complete these kinds of tasks which could have taken at least weeks if not months to make these simple apps.
9. I asked Claude to do some calculations which it did and there was no code written in front but then I asked it to show me code and it gave me python code.

10. I asked it to give me a safe workflow which it gave me in complete detail so I learned how to use AI safely.
11. I used chat Gpt and Claude to give me a 12 hour vacation plan and surprisingly their plans were pretty similar.
12. I asked Chatgpt to write 150-250 article on world economic conditions right now, then asked Gemini and Claude to taste it, both gave almost same reasons for their assessment but Gemini was more generous in score, all of its scores were more than claudes, gemini gave 9 on clarity claudes gave 7 and same happened with other factors.

Take away

By going through this exercise I learned a lot about best prompting practices. Before this exercise my prompting was a little random at times and on the mercy of LLM, but now I know how to use context, loaded words to invoke reasoning and how to get more output with little effort.
